

Enterprise Reporting Server for iPrism

ERS for iPrism was created to deliver fast, comprehensive and archivable reporting for organizations that deploy multiple iPrisms in distributed environments. The high-performance ERS appliance provides a wide-range of roll-up reports that give you instant visibility on Internet activity across your organization. With Enterprise Reporting Server for iPrism, you have the tools you need to protect your sensitive customer data and intellectual property, help you conform to regulatory requirements such as the Sarbanes Oxley Act (SOX) or HIPAA and fulfill your own organization's acceptable use policy (AUP) and security policies.

The ability to protect your organization by enforcing your policies and securing your sensitive and proprietary data is dependent on strong and accurate reporting.

- **Comprehensive Aggregate Reporting Across your Enterprise**
- **Fast and Flexible with Superior Failover Protection**

Highlights

Improved Productivity

Enterprise Reporting Server for iPrism gives you both instant and long-term views of all Internet activity whether at local or remote locations. With drill-down reporting you can isolate to a single user so you can spot productivity problems and address them before they get out-of-hand. You may also identify those users who are non-compliant with your AUP and Security Policy.

Strengthen Security

Inadvertent downloading by users is the primary way spyware, malware and phishing can invade and damage your network. Unauthorized use of IM and P2P applications are also prime doorways for exploits. Enterprise Reporting Server for iPrism allows you to monitor and report on all Internet protocols across your entire organization so you can pinpoint problems instantly, whether intentional or through employee negligence.

Avoid Liability

Your AUP may prohibit employees from accessing sites that are inappropriate, but you have no way of enforcing your rules without visibility into online behavior. Lawsuits may begin with objectionable Internet content and can damage your organization's financial well-being and ruin its reputation. Enterprise Reporting Server for iPrism allows you to know where policy violations are occurring so you can deal with infractions quickly, before they turn into serious situations.

Conserve Network Resources

The Internet is rife with sites that consume large amounts of bandwidth and most of them are non-business related. Instead of being frustrated at the drain on your resources, Enterprise Reporting Server for iPrism shows you where your network is being impeded and slowed by bandwidth-intensive activities such as Internet media services. You can then block these sites easily with your iPrism. Enterprise Reporting Server for iPrism can also provide a view of your Internet activity that can help you plan, by giving you a better understanding of how your network is being utilized.

Features

Unrivalled Reporting Capacity and Reporting Archiving

Enterprise Reporting Server for iPrism allows you to report on events across multiple installations of iPrism appliances. It supports over 100 million events generated per day from all iPrisms, across your network, and contains over 1TB of storage capacity, enough for more than 2 billion web access and IM/P2P events. You can generate reports that cover long-term usage and retain reports previously run, which can show trends and usage by location, individual user, or for your entire organization. This 1TB of storage is in an industrial strength RAID 10 configuration, which provides unrivalled redundancy and performance.

Generate Reports in Seconds

Enterprise Reporting Server for iPrism can generate reports faster than any other competitive solution. Depending upon your environment and the report selected, your reports are ready for viewing up to 100X faster than other solutions on the market. You won't waste your valuable IT resources waiting for even large, enterprise-wide reports - Enterprise Reporting Server for iPrism can deliver many of them within seconds. It also automatically indexes the database every night so you can quickly generate previous-day reports.

Superior Flexibility

Enterprise Reporting Server for iPrism provides reporting flexibility that allows you to schedule multiple reports to run any time you choose, while easily generating on-demand reports at the same time. Other reporting enhancements include more flexibility to handle deployments of multiple iPrisms with more filtering, grouping and sorting capabilities so you can generate a variety of reports across your entire iPrism deployment. And it's easy-access GUI makes choosing reporting templates easy, with the templates you need right at your fingertips.

Failover Protection

Enterprise Reporting Server for iPrism failover features reach a new level in data protection. It has a dual-power supply so data cannot be lost under even the most adverse conditions. The hot-swappable RAID 10 hard drives mean your data is always protected.

Hardware Specifications

Form Factor
1U height, rack-mountable
Dimensions
1.75"(H) x 19"(W) x 25.6"(D)
Weight
50 lbs
Rails
Included
Chipset
Intel 5000P
Processor
Intel Quad-Core Xeon 3.0 GHz
Disk
4 x 500 GB Hot Swap SATA
RAID Controller
3ware 9650-4LP RAID controller RAID 1 (Mirrored)
Memory
4096MB (4GB) SDRAM (DDR2 Registered ECC Server RAM)
Ethernet Interface
2 x 10/100/1000 Management NIC
AC Power
100-240 VAC, 50-60 Hz, 4.0-8.0A@115V; 650W
Dual Hot-Swap Power
Yes
Heat
1850 BTU per hour (max.)
Operating Temperature
10° to 35°C, 50° to 95°F
